PROFESSIONAL SUMMARY

BCA student and self-directed Data Engineering learner with hands-on experience building end-to-end ETL pipelines in Python, SQL, and PySpark. Skilled in extracting data from REST APIs, CSV, and JSON sources, transforming and validating it with Pandas, and loading into relational databases. Comfortable with distributed processing concepts including window functions, broadcast joins, and partitioned Parquet output. Seeking a Data Engineering internship to apply and grow these skills in a production environment.

TECHNICAL SKILLS

Languages: Python, SQL

Data Processing: Pandas, NumPy, PySpark (window functions, broadcast joins, partitioned Parquet)

Databases: MySQL, SQLite

ETL & Integration: REST API ingestion, CSV/JSON parsing, multi-source data integration, data validation

Database Design: Schema design, normalization (1NF-3NF), relational modeling

Tools: Git, GitHub, Jupyter Notebook, VS Code

Concepts: ETL pipeline design, distributed data processing, query optimization, data cleaning

PROJECTS

India Smart City Analytics Pipeline

Python, Pandas, REST API, MySQL

- Designed and built a multi-source ETL pipeline integrating a live REST API, CSV files, and JSON data into a unified MySQL database for smart city analytics.
- Implemented extraction logic to pull and parse data from a live external API alongside static file sources, handling inconsistent schemas across sources.
- Built transformation logic in Pandas to clean, validate, and merge multi-source datasets before loading into normalized MySQL tables.
- Structured the pipeline into modular extract, transform, and load stages to support maintainability and reuse across future data sources.

NYC Taxi Trip Data Pipeline (PySpark)

PySpark, Python, Parquet

- Built a distributed ETL pipeline on NYC Taxi trip data using PySpark to process large-scale trip records.
- Applied window functions to compute trip-level aggregations and ranking metrics across partitions.
- Used broadcast joins to efficiently merge large trip data with smaller reference/lookup datasets, reducing shuffle overhead.
- Wrote transformed output as partitioned Parquet files to optimize downstream query performance and storage.

Employee Management System (SQL)

MySQL, SQL

- Designed a normalized relational schema for an employee management system, applying 1NF-3NF principles to eliminate redundancy.
- Wrote SQL queries covering joins, subqueries, CTEs, aggregate functions, and CASE WHEN logic for HR-style reporting scenarios.
- Practiced and resolved logical errors in complex queries to build accuracy and confidence with real-world query patterns.

EDUCATION

Bachelor of Computer Applications (BCA)

Shivaji University, Kolhapur, Maharashtra

Expected 2027

CERTIFICATIONS & COURSEWORK

- Introduction to Data Engineering — IBM (Coursera)
- Python for Data Science, AI & Development — IBM (Coursera)
